1. Overview

Component Name	ID	Description	ODA Function Block
----------------	----	-------------	--------------------

Product Test Management	TMF C054	Product Test Management is responsible for: - Product Test Specification: for each Product Specification, identification of the possible tests to launch automatically, by the delivery or assurance processes, or manually by the customer or user, or by a CSR, to test a product functioning. They are based on tests available at service specification level (or resource specification level for a tangible product) - Product Test end-to-end execution and reporting according to the context and/or the actor	Core Commerce
-------------------------	----------	--	---------------

TMFC054: Product Test Management

2. eTOM Processes, SID Data Entities and Functional Framework Functions

2.1. eTOM business activities

eTOM business activities this ODA Component is responsible for.

Identifier	Level	Business Activity Name	Description
1.2.1	L2	Product Portfolio Strategy Management	Product Portfolio Strategy Management includes activities to make decisions about products to develop, maintain, or phase out. It also has oversight on Product Allocation to maximize growth and profitability across the entire product portfolio, and individual Product Strategy to outline how a product will operate and support the business strategy and goals. Product Portfolio Strategy Management plans, supports development, and overseeing a product from concept to market release.
1.2.1.5	L3	Product Test Strategy	Product Test Strategy develops the strategies of the enterprise for Product Test. This process is in charge of identifying types of Product Test to be conducted according to different context (i.e. business activities) for types of products. The different context for Product Test are: - Product Specification Development & Retirement to qualify the capacity to deliver Products before validating a new ProductSpecification, - Order Handling (Customer Order Orchestration) to test the Product before closing the CustomerOrderItem, - Product Performance Management to test Product performance, - Customer Problem Handling to test Product functioning, - Product Test Management to conduct tests not specific to a customer's product.
1.2.4	L2	Product Support Management	Product Support Management processes ensure the support capability is in place to allow the CRM Fulfillment, Assurance and Billing processes to operate effectively.

1.2.4.9	L3	Manage Product Test	Manage Product Test processes manage the end-to-end execution of a test or test scenario for products not specific to a customer. Tests can be manual or automated. Product Test Management processes rely on Service Test Management and Resource Test Management processes due to dependencies between product tests, service tests and resource tests. Product Test Management includes: - Identification of product tests needed according to fulfillment and assurance issues - triggering of product tests in manual or automated mode - Execution of product tests - Verification of test authorization (role and context) and quota management - Identification and prioritization of tests - Setting up the test context and configuration - Triggering appropriate service & resource Tests - Tests can be on-demand or planned according to specific needs - Enrichment with service and resource tests results based on applicable product test rules - Reporting of test results
---------	----	---------------------	---

2.2. SID ABEs

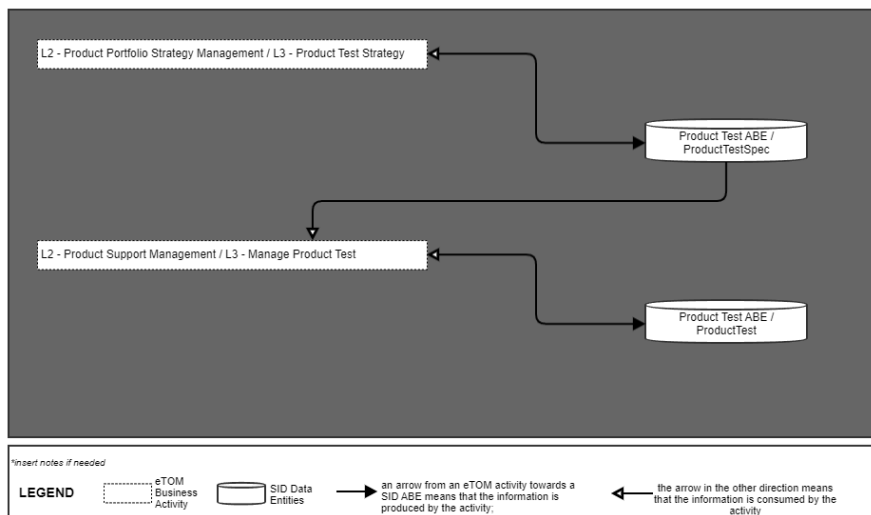

SID ABEs this ODA Component is responsible for:

SID ABE Level 1	SID ABE Level 2 (or set of BEs)*
Product Test ABE*	-

*includes ProductTestSpec and ProductTest BEs

2.3. eTOM L2 - SID ABEs links

eTOM L2 vS SID ABEs links for this ODA Component.

2.4. Functional Framework Functions

Function ID	Function Name	Function Description	Aggregate Function Level 1	AF L1 Id	Aggregate Function Level 2	AF L2 Id
1073	Product Test Specification Design	Product Test Specification Design is in charge of designing Product Test Specification. It includes - Defining the Product Test Specification, depending on the atomic product specification, based on a Service Test Specification or directly a Resource Test Specification (for example for a resource like a box, a STB) - Managing product test capabilities: the underlying service or resource tests used to define the product test have limitation that must be taken into account. Additional limitations can be enforced at the product level especially for the self-tests for the users - Managing initiator authorization: some tests are restricted to some user roles (internal or external) so the authorization are defined at the Product Test Strategy and Policy Management.	Product Specification & Offering Management	2.3.1	Product Test Specification Development	2.3.1.3

1074	Product Test Configuration Design	Product Test Configuration Design Function specifies Test rules defining the strategies for setting up test configuration that are necessary for executing the service or resource test on which the product test is based.	Product Specification & Offering Management	2.3.1	Product Test Specification Development	2.3.1.3
1075	Product Test Restitution Design	Product Test Restitution Design Function specifies Test rules defining the restitution of the result depending on test execution context. For example: a test result of ok/not ok can be enough for a user whereas customer care may require more details in the result of the test.	Product Specification & Offering Management	2.3.1	Product Test Specification Development	2.3.1.3
1130	Product Test Authorization Check	Product Test Authorization Check Function verifies test authorization and quota management: product test execution checks.	Product Test Management	2.4.2	End to End Product Test Execution	2.4.2.1
1131	Product Test Execution	Product Test Execution Function includes: • Carrying out test priority: for example, the priority of a self-care test for a user is higher than a back-office test • Retrieval of appropriate inventory data and setting up the test context and configuration • Test execution with access to the various data required to perform product testing • A product test main actions will be to trigger service or resource tests depending on the product composition • Data collected during product test can be inventory data (for example in IS inventory) or data coming from service or resource tests • Test execution produces a test result that may contain a raw result and an enrichment of this result depending on the product test definition and associated rules. For example: for an access product test the raw result can be the associated bandwidth and an enrichment can be done depending on the user access type (fiber, xds) to evaluate if the result is suitable or not.	Product Test Management	2.4.2	End to End Product Test Execution	2.4.2.1
1132	Product Test Reporting	Product Test Reporting Function includes: • Test results restitution: the restitution of the raw test results may depend on the test execution context data. - For the same test, depending on the initiator, the result restitution can be more or less detailed. The user /customer needs less technical details in self-care whereas customer care needs more and more details with higher care level. - However test result restitution levels must always be mutually consistent through all the execution context. • Test results long term logging for offline data analyses. These analyses are done outside of Product Test Management. • Possible reporting of test results back to the initiator of the test.	Product Test Management	2.4.2	End to End Product Test Execution	2.4.2.1

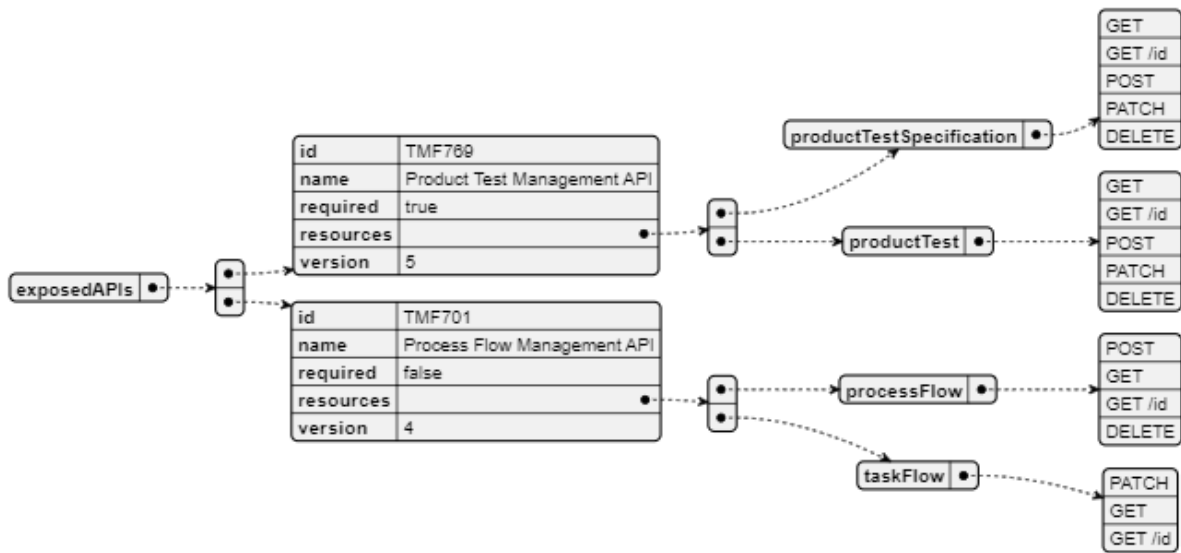

3. TM Forum Open APIs & Events

The following part covers the APIs and Events; This part is split in 3:

- List of **Exposed APIs** - This is the list of APIs available from this component.
- List of **Dependent APIs** - In order to satisfy the provided API, the component could require the usage of this set of required APIs.
- List of **Events (generated & consumed)** - The events which the component may generate is listed in this section along with a list of the events which it may consume. Since there is a possibility of multiple sources and receivers for each defined event.

3.1. Exposed APIs

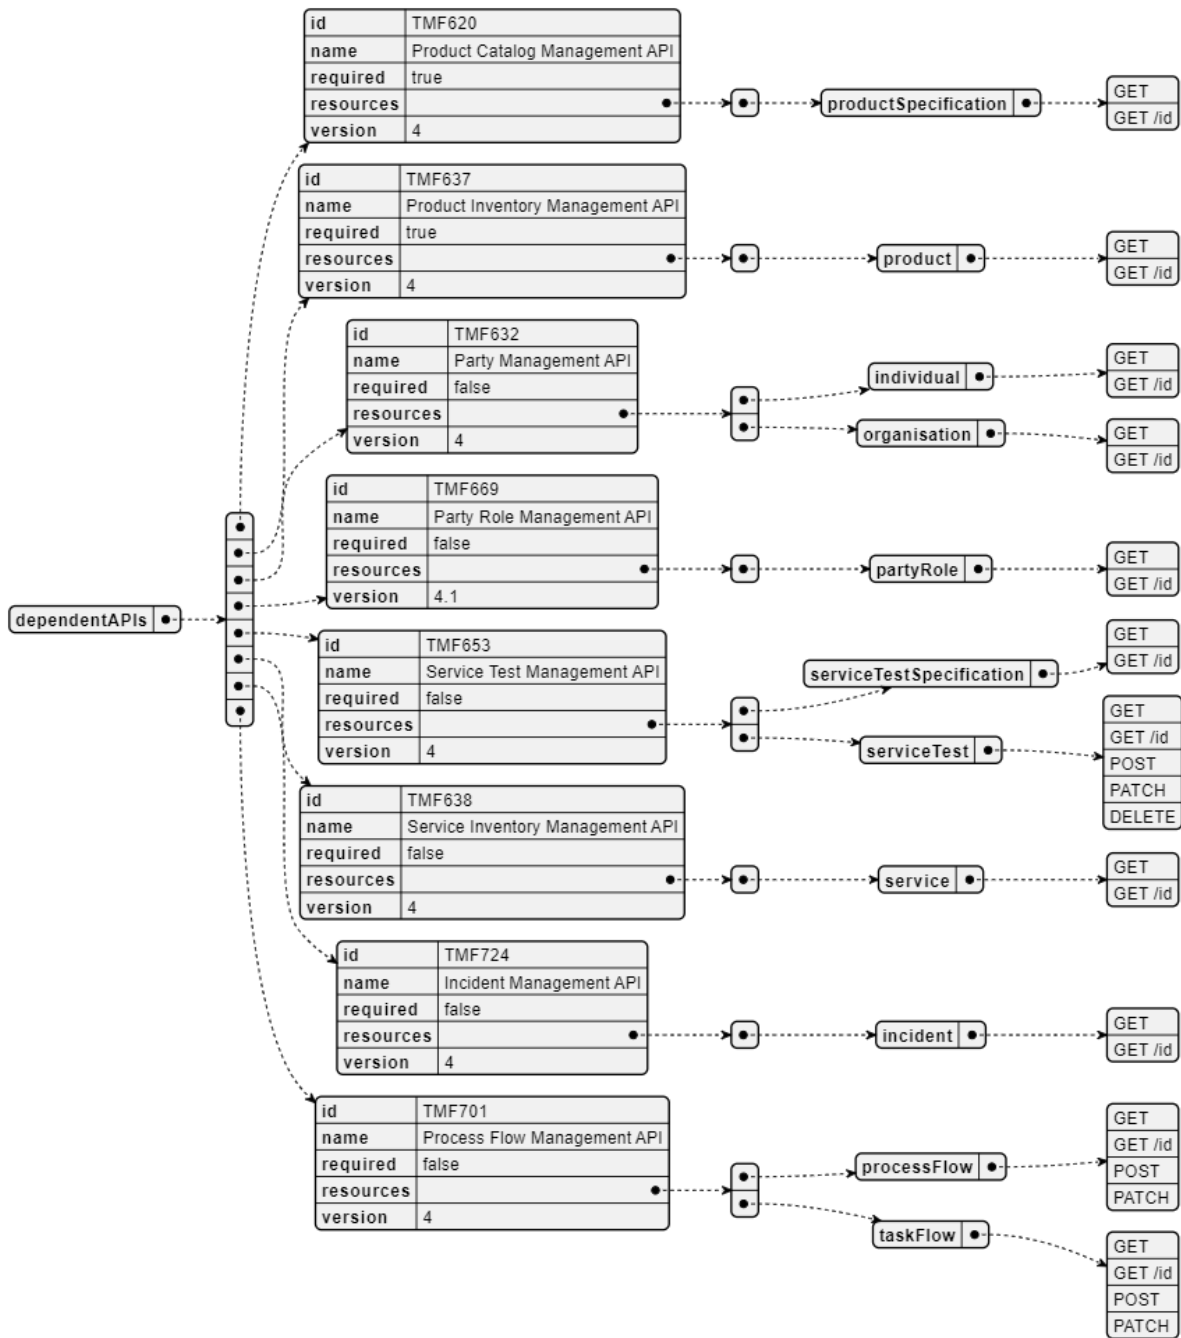

Following diagram illustrates API/Resource/Operation:

API ID	API Name	API Version	Mandatory / Optional	Operations
TMF769	Product Test	V5	mandatory	productTestSpecification: GET, GET /id, POST, PATCH, DELETE productTest: GET, GET /id, POST, PATCH, DELETE
TMF701	Process Flow	V4	optional	processFlow: POST, GET, GET /id, DELETE taskflow: PATCH, GET, GET /id

3.2. Dependent APIs

Following diagram illustrates API/Resource/Operation potentially used by the Product Test Management component:

API ID	API Name	API Version	Mandatory / Optional	Operations	Rationale
TMF620	Product Catalog Management	V4	Mandatory	productSpecification: GET, GET /id	a ProductTestSpecification must be associated to an existing ProductSpecification
TMF637	Product Inventory Management	V4	Mandatory	product: GET, GET /id	a ProductTest must concern an existing Product
TMF632	Party Management	V4	Optional	individual: GET, GET /id organisation: GET, GET /id	
TMF669	Party Role Management	V4	Optional	partyRole: GET, GET /id	
TMF653	Service Test (1)	V4	Optional	serviceTestSpecification: GET, GET /id serviceTest: GET, GET /id, POST, PATCH, DELETE	a ProductTestSpecification related to an intangible ProductSpecification should correspond to an existing ServiceTestSpecification; a ProductTest related to an intangible Product triggers a ServiceTest on the corresponding Service.
TMF638	Service Inventory Management (1)	V4	Optional	service: GET, GET /id	

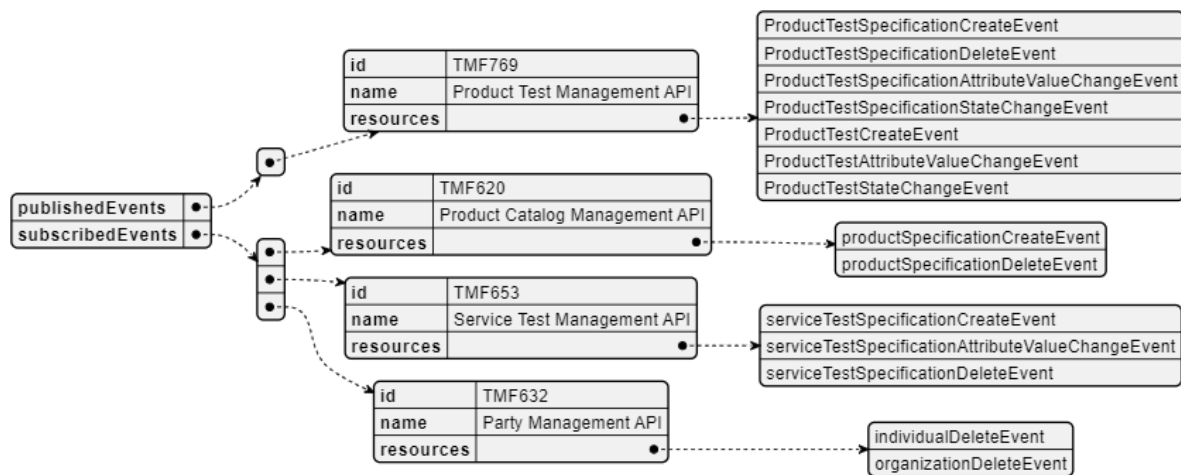

TMF724	Incident Management	V4	Optional	incident: GET, GET/id	
TMF701	Process Flow	V4	Optional	processFlow: GET, GET /id, POST, PATCH, taskFlow: GET, GET /id, POST, PATCH,	

Note (1): no link to this information is currently described in the resource model of the draft TMF769 API. Refer to Jira ticket.

Note: when available the Resource Test API should be added as dependent API, as Resource Inventory Mgt API. Refer to Jira ticket.

3.3. Events

The diagram illustrates the Events which the component may publish and the Events that the component may subscribe to and then may receive. Both lists are derived from the APIs listed in the preceding sections.

4. Machine Readable Component Specification

Refer to the ODA Component table for the machine-readable component specification file for this component.

5. References

5.1. TMF Standards related versions

Standard	Version(s)
SID	24.5
eTOM	24.5
Functional Framework	24.5

5.2. Jira References

Note: Same needs as at Service level for non-tangible products + add of Resource Inventory APIs to be consistent.

5.2.1. SID

[\[ISA-1251\] Improve the description of Product/Service/Resource Test ABEs - TM Forum JIRA](#)

The links between ProductTest, ServiceTest and ResourceTest need to be described, at specification and instance levels. For example,

- a ProductTestSpecification related to an intangible ProductSpecification should correspond to an existing ServiceTestSpecification
- a ProductTest related to an intangible Product triggers a ServiceTest on the corresponding Service.
- a ProductTestSpecification related to a tangible ProductSpecification should correspond to an existing ResourceTestSpecification
- a ProductTest related to a tangible Product should trigger a ResourceTest on the corresponding Resource.

5.2.2. APIs

As

- a ProductTestSpecification related to a tangible ProductSpecification should correspond to an existing ResourceTestSpecification;
- a ProductTest related to a tangible Product should trigger a ResourceTest on the corresponding Resource.

[\[AP-6690\] TMF769 - add reference to ServiceTest and ResourceTest - TM Forum JIRA](#): TMF769 Product Test API is only available in preview - but contains no links to Service Test or Resource Test, where the real tests are done.

[\[AP-6691\] New API : Resource Test API - TM Forum JIRA](#): No Resource Test Management API identified yet, while we should be able to check that:

6. Administrative Appendix

6.1. Document History

6.1.1. Version History

Version Number	Date Modified	Modified by:	Description of changes
1.0.0	04 Mar 2025	Sylvie Demarest	Initial version
1.0.0	04 Mar 2025	Rosie Wilson	Final administrative updates prior to publication

6.1.2. Release History

Release Status	Date Modified	Modified by:	Description of changes
Pre-production	04 Mar 2025	Rosie Wilson	Preparation for initial release
Pre-production	21-Apr-2025	Adrienne Walcott	Updated to Member Evaluated status

6.2. Acknowledgements
